The invention discloses a method for determining the amount of an analyte in a fluid sample in the presence of an interfering substance. The method comprises contexting a solid surface, dual-coated with an antibody recognising an recognising a free analyte and a second antibody recognising an interfering substance when bound to the analyte and analyte bound to the interfering substance. The example in this specification discloses the quantitative determination of serum HERCEFTIN levels in patients undergoing HERCEFTIN therapy. The method accurately determines the amount of an anti-HERZ antibody in serum or plasma in the presence of an HERZ commain (ECD). The labelled secondary antibody recognised by the first antibody as well as different from that recognised by the first cattibody, as well as different from that recognised by the HERZ ECD. The method is useful for accurately determining the amount of an antibody, an unit-HERZ, that is circulating in a fluid sample (serum or plasma) content of an interfering substance (the ECD) of the HERZ oncogene. The presence of an interfering substance (the ECD) of the HERZ oncogene. The method prevents loss of detection in the quantitative assays and an ender prevents in the quantitative assays and an ender the quantitative assays and an ender the patholism of Ammain HERZ oncogene. human HER2 receptor extracellular domain

```
The present sequence is the extracellular HBR-2/neu protein. HBR-2/neu is a member of the tyrosine kinase family of receptor-like glycoproteins and shows homology to the epidermal growth factor receptor (BGRN). It probably plays a part in cell growth and/or differentiation. The HBR-2/neu gene is an oncogene. An HBR-2/neu fusion protein comprising a HBR-2/neu extracellular domain fused to a HBR-2/neu phosphorylation domain may be used to treat or prevent cancer by eliciting or enhancing an immune response to the HBR-2/neu protein. It may be used to treat malignancies such as breast, ovarian, colon, lung and prostate cancers, and may be used as an antigen to vaccinate against these neoplasias
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ELTYLPTNASLSFLQDIQEVQGYVLIAHNQVRQVPLQRLRIVRGTQLFEDNYALAVLDNG 120

                                                                          The invention describes a method of treating cancer that expresses ErbB2 comprising administering to a patient an antibody that binds BrbB2. Paticulally claimed are antibodies that bind BrbB2, particularly concelloral antibody 20% or monoclonal antibody 4D5 or monoclonal antibody 4D5 or humanised 4D5. The methods are useful for treating cancer in a patient, batticularly a human. The cancer includes carcinome, lymphome, blastoma, sarcoma, liposarcoma, neuroendocrine tumour, mesothelloma, schwanoma, cancer, lung cancer, por-small squamous cell cancer, epithelial squamous cell cancer, pithelial squamous cell cancer, pithelial squamous cell cancer, por-small call lung cancer, denocarcinoma of the lung, squamous carcinoma of the lung, cancer, pancreatic cancer, pastric or stomach cancer, denocarcinoma of the peritoneum, hepatocellular cancer, gastric or stomach cancer, gastrointestinal cancer, bladder cancer, hepatocal cancer, prostate cancer, colorectal cancer, hepatocal cancer, prostate cancer, cancer, prostate cancer, hepatic carcinoma, resilvary y gland carcinoma, kidney or renal cancer, prostate cancer, hepatic carcinoma, a tumour of the biliary tract, or head and neck cancer. This is the amino acid sequence of human

The present sequence is that of the extracellular domain of human Her-
2/neu (p185 glycoprotein or c-erbB2), an oncogenic self-protein and
carget for anit-cancer vaccines. The Her-2/neu gene is amplified and p185
c is overexpressed in a variety of cancers, including breast, ovarian,
c colon, lung and prostate cancer. Her-2/neu (see AAM51143) is a member of
the tyrosine kinase family of receptor-like glycoproteins. It comprises
an extracellular domain with homology to the epidermal growth factor
c receptor (EGFR), a highly hydrophobic transmembrane domain and a C-
c remainal intracellular domain that also shows homology to EGFR. Its
coverexpression correlates with a poor prognosis in breast and ovarian
c ancers. The invention provides Her-2/neu fusion proteins, nucleic acids
c crocing them, viral vectors, and vaccines comprising the fusion proteins
c ancellular domain of a Her-2/neu protein is fused to a Her-2/neu
c extracellular domain of a Her-2/neu protein is fused to a Her-2/neu
c infracellular domain of phosphorylation domain (or its Deltap) fragment).
An immune response to Her-2/neu protein is elicited or enhanced by
c administering the fusion protein in the form of a vaccine, or by
c transfecting cells of an animal ex vivo with a nucleic acid encoding the
c fusion protein, and delivering the transfected calls to the animal. The
c fusion protein, and delivering the transfected calls that specifically
c for inhibiting the development of a cancer, especially breast, ovarian,
c colon, lung or prostate cancer in a patient of cancer in a patient
c from a sample in order to inhibit the development of cancer in a patient
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Her-2/neu fusion protein for treating or preventing cancer by eliciting or enhancing an immune response to the protein, has Her-2/neu extracellular domain fused to Her-2/neu intracellular or phosphorylation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Length 653;

receptor-like glycoproteins and shows homology to the epidermal growth factor receptor (BGRR). It probably plays a part in cell growth and/or differentiation. The HER-2/neu gene is an oncogene. HER-2/neu fusion proteins may be used to treat or prevent cancer by eliciting or enhancing an immune response to the HER-2/neu protein. They may be used to treat malignancies such as breast, ovarian, colon, lung and prostate cancers, and may be used as an antigen to vaccinate against these neoplassias
                                                                                                                                                                                                                                                                                       120

The present sequence is that of a fusion protein between the extracellular domain and a fragment (DeltaPD) of the phosphorylation domain of human Her-2/neu (see AAM5143), an oncogenic self-protein and target for anti-cancer vaccines. The fusion protein can be obtained by recombinant DNA methods. Her-2/neu overexpression correlates with a poor prognosis in breast and ovarian cancers. The invention proteins and vaccines comprising the fusion proteins or nucleic acid molecules. In preferred fusion proteins, the extracellular domain of Her-2/neu is fused to a Her-2/neu proteins, the extracellular domain of Her-2/neu is fused to a Her-2/neu proteins, the extracellular domain of Her-2/neu is fused to a Her-2/neu protein, and immune response to Her-2/neu protein is elicited or chanced by administering the fusion protein in the form of a vaccine, by transfecting cells of an animal ex vivo with a nucleic acid encoding the fusion protein, and delivering the transfected cells to the animal.

The fusion protein, and delivering the transfected cells to the animal. Or inhibiting the development of a cancer, especially breast, covarian, colon, lung or prostate cancer in a patient. T cells that specifically react with a Her-2/neu fusion protein can be used to remove thmour cells from a sample in order to inhibit the development of cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   A fusion protein (AAM19764) comprises Her2 (a growth factor receptor that is overexpressed in breast, ovarian can other cancer cells) and granulocyte-macrophage colony stimulating factor (GM-CSF). It is the expression product of a nucleic acid molecule (AAT72725) prepd. by PCR emplification of Her2 CDNA from a breast cancer cell line and fusion to GM-CSF CDNA. Fusion expression vectors can be used to transfect mammalian and insect cells. The Her2-GM-CSF fusion protein is used to generate antiater 1 minuty. Tumour cells are eliminated by cytocoxic Tlymphocytes activated in vivo or in vitro by exposure to antigen-presenting cells exposed to the fusion protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    61 ELTYLPTNASLSFLQDIQEVQGYVLIAHNQVRQVPLQRLRIVRGTQLFEDNYALAVLDNG 120

The present sequence is a fusion protein comprising the extracellular domain and the phosphcrylation domain of the human HER-2/neu protein. HER 12/neu is a member of the tyrosine kinase family of receptor-like glycoproteins and shows homology to the epidermal growth factor receptor (EGFR). It probably plays a part in cell growth and/or differentiation. The HER-2/neu gene is an oncogene. HER-2/neu fusion proteins may be used to treat or prevent cancer by eliciting or enhancing an immune response to the HER-2/neu protein. They may be used to treat malignancies such as breast, ovarian, colon, lung and prostate cancers, and may be used as an antigen to vaccinate against these neoplasias
                                                                                                                                                                                                                                                                                                 300

GENERAL INFORMATION:
APPLICANT: Cheever, Martin A.
APPLICANT: Disis, Mary L.
TITLE OF INVENTION: IMMUNE REACTIVITY TO HER-2/new PROTEIN
TITLE OF INVENTION: POR DIAGNOSIS AND TREATMENT OF MALIGNANCIES IN WHICH THE
TITLE OF INVENTION: HER-2/new ONCOGENE IS ASSOCIATED
NUMBER OF SEQUENCES: 69

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
